Special Issue: Data-Driven Business Processes and Decision Optimization

Dear Guest Editors,

Please consider our research article, "Seeing the Process Through the Worker's Eyes: Event Logs from Egocentric Factory Videos", by Alessandro Berti and Wil M. P. van der Aalst, for the special issue "Data-Driven Business Processes and Decision Optimization" in *Systems*.

Our five-stage pipeline narrates egocentric factory videos, aggregates descriptions across workers, and induces shared factory vocabularies before assigning events. Generation uses no task-specific fine-tuning or labeled event examples. We distinguish this design from prior video-to-log methods, especially Vid2log, through its vocabulary construction and findings about retrospective process measurements.

The resource links intermediate text and vocabularies to 322 logs with 10,698 events from 59 workers in six factories. The revision adds formal definitions, traceable examples, and reproducible measurements. Existing examples show how process-based categories can hide recorded transport and how inferred boundaries affect durations. The author audit assesses transcript agreement; video accuracy remains unmeasured. Timestamp inconsistencies, unequal observation windows, and analyst-defined categories limit operational conclusions.

The paper fits the special issue's focus on process mining, process performance evaluation, and improvement in industrial systems. It connects human work with digital process analysis and provides evidence to guide process design decisions. The pipeline, prompts, derived data, and assessment code are publicly available.

The manuscript has not been published and is not under consideration for publication elsewhere. Both authors approve the manuscript and agree to its submission to *Systems*. The manuscript includes declarations on author contributions, funding, ethics and consent, data availability, use of AI tools, and conflicts of interest.

Thank you for considering our submission.

Sincerely,

Alessandro Berti
